AI PRODUCT MANAGER · DATA & AI TRANSFORMATION · CASE

Win. Match. Optimize.

A Phase 1 roadmap that turns every campaign into proprietary creator data, and earns The Lemon Shot the right to build a Creator Retail Media Network in Year 2.

THE LEMON SHOT 3 NOV 2026

The answer on one page

01 · WIN — MONTHS 1-2

Proposal Copilot

CAMPAIGN PROPOSAL

Quick win. AI drafts the research, credentials and structure of a pitch. Strategists own the Big Idea.

02 · MATCH — MONTHS 2-4

Creator Match

CREATOR SELECTION MATRIX

The moat. Brief in, brand-safe and explained shortlist out in minutes, built on our own performance data.

03 · OPTIMIZE — MONTHS 4-6

Campaign Pulse

CAMPAIGN OPTIMIZATION

Closes the loop. Live insights, human-approved changes, and sales outcomes written back to the creator data.

YEAR 2

Creator RMN: build on Phase 1 data. **Trend Monitoring**: buy. **DCO**: after likeness governance.

BUILD VS BUY

Rent the model, own the memory. Buy commodity layers. Build the creator graph, scoring and feedback labels.

HUMAN X AI

AI drafts, humans decide. Nothing reaches a client, a creator or an ad budget without a named approval.

PROOF

AI-assisted brief coverage of 70% in pilot squads by month 6, plus a **Creative Confidence** pulse.

Three tools, one loop, one data asset. Each campaign makes the next pitch faster, the next shortlist smarter, and the Year-2 RMN more real.

CONTEXT

Designing for a young, lean, creator-led agency with real commerce results

THE LEMON SHOT TODAY

- **Founded 2023 in Bangkok.** Content-led, full-funnel. LinkedIn lists 11-50 people.
- **750+ brands served** and a **100M+ follower** creator network.
- **Retail-commerce proof:** Lotus's (250M views with 127 KOLs; double-digit sales growth from gifting), makro (875K+ followers), AMAZE (88%+ lower CPR, 60% better conversion).
- **Creator House:** Academy, Growth and Clinic, with performance tracking.
- Social and live commerce, Xiaohongshu cross-border work, and early AI work (AI Seeder).

CONSTRAINTS I'M DESIGNING AROUND

- **No software engineers.** I build the Phase 1 MVPs myself, in low-code.
- **2 Data Analysts** own the pipelines, and their work is the critical path.
- **Leadership wants everything yesterday.** We need a visible win within weeks.
- **Creative teams resist** tools that disrupt how they already work.
- **A small team**, so every strategist hour is scarce.

> **Implication:** the raw material for a moat already exists in campaign history, creator relationships and retail outcomes. It just isn't structured, consented or connected yet.

Sources: company website, LinkedIn and Marketing Oops, read Oct 2026. Public figures vary by source and are used for scale, not precision.

ASSUMPTIONS

What I assumed, and why

Every number in this deck traces back to one of these. If one is wrong, the logic holds and only the numbers move.

ASSUMPTION	BECAUSE	VALIDATE IN WEEK 1
About 20 campaigns and 20 new proposals a month. Some campaigns use 100+ creators	750+ brands since the 2023 founding is about 22 new brand engagements a month. Lotus's ran 127 KOLs.	CRM and finance export
A proposal takes about 12 strategist-hours. A shortlist takes about 6 hours, and days at 100+ creators	Research, benchmarks and deck building. Vetting profiles by hand across 3-4 platforms.	2-week time diary in the pilot squad
History lives in decks, Sheets and platform exports. There is no warehouse	That is why this transformation exists.	DA data audit
Creator House creators will connect their accounts (OAuth)	Value exchange: free performance insights and better-matched paid work.	Pilot with 20 creators
Google Workspace plus Slack or Google Chat; LINE for creators	LINE links on the company site; Workspace is common in Thai agencies. The logic is tool-agnostic.	IT check
DAs at least 70% on this work, at most USD 1,000 a month for tools, and PDPA applies	Otherwise the critical path slips. Pilot scale. We process Thai personal data.	Leadership and DPO

Gate first, then score, then stress-test

1 · GATE (PASS/FAIL)

Can an MVP ship within **6 months** using **low-code and 2 DAs**, on data we can lawfully access, without needing a new legal framework first?

2 · SCORE 1-5

Impact on win rate, retention or margin. Feasibility under our constraints. Moat and compounding. Speed to value. Adoption and risk (5 = low risk).

3 · STRESS-TEST THE WEIGHTS

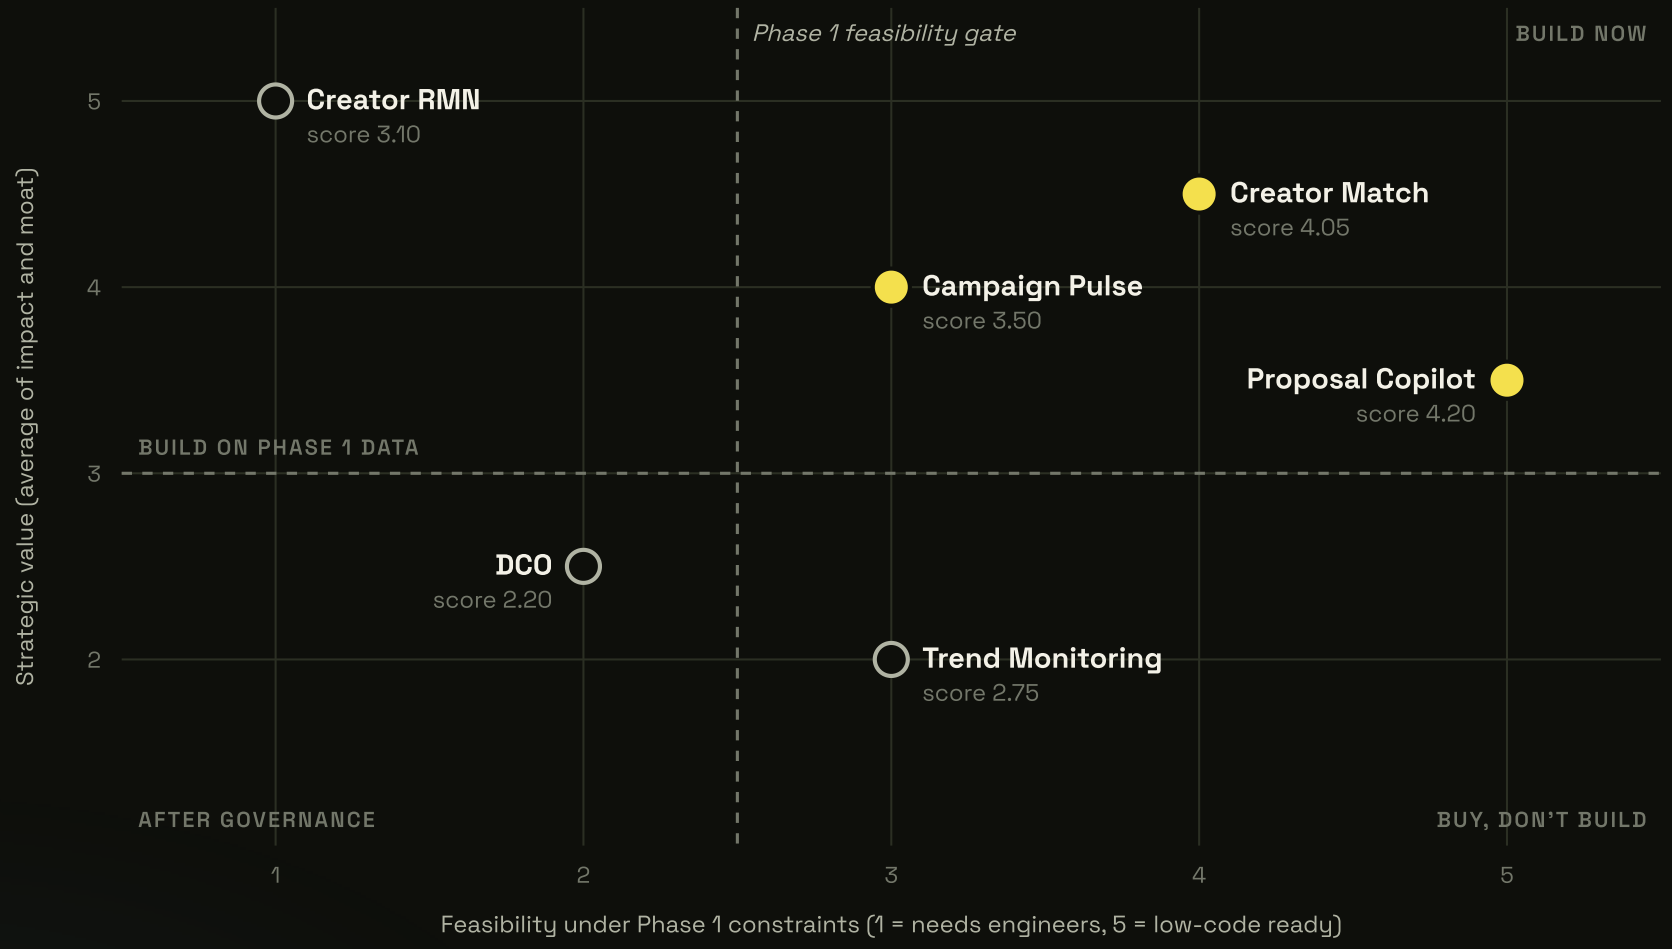

Does the top 3 change if leadership values impact, moat or speed more?

Base | Impact-heavy | Moat-heavy | Speed-heavy

USE CASE	IMPACT 30%	FEASIB. 25%	MOAT 20%	SPEED 15%	ADOPT. 10%	SCORE	VERDICT
Campaign Proposal Proposal Copilot	4	5	3	5	4	4.20	PHASE 1
Creator Selection Matrix Creator Match	4	4	5	3	4	4.05	PHASE 1
Campaign Optimization Campaign Pulse	4	3	4	3	3	3.50	PHASE 1
Creator RMN build on Phase 1 data	5	1	5	1	2	3.10	YEAR 2 · FAILS GATE
Trend Monitoring buy, not build	2	3	2	4	4	2.75	YEAR 2
DCO after likeness governance	3	2	2	2	1	2.20	YEAR 2 · FAILS GATE

Under every weighting, the same three win. **RMN loses on feasibility, not on value:** it scores 5 on impact and moat.

Build what is valuable and buildable now. Stage what isn't.

BUILD NOW · PHASE 1

Proposal Copilot, Creator Match and Campaign Pulse: valuable **and** buildable with low-code and two analysts.

BUILD ON PHASE 1 DATA · YEAR 2

Creator RMN is the destination. Phase 1 builds the creator graph, commerce attribution and consent it needs.

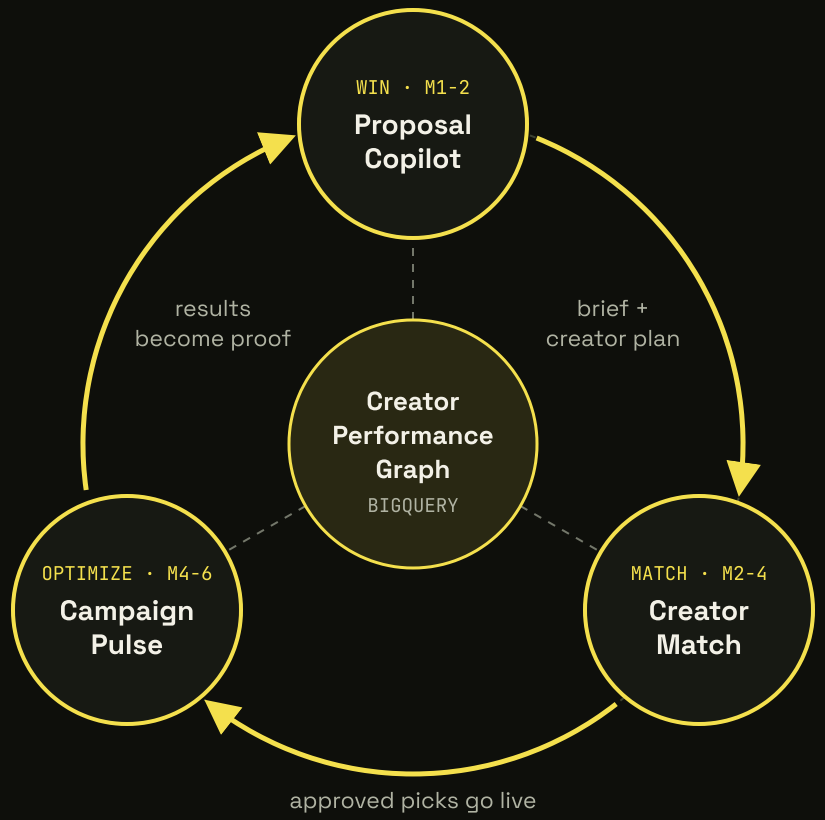

BUY, DON'T BUILD

Trend Monitoring: commodity signals, mostly behind restricted platform APIs. Vendors exist.

AFTER GOVERNANCE

DCO: the most likeness and IP risk, and platforms already ship gen-AI creative tools.

One loop, three flywheels

DATA FLYWHEEL

Every campaign writes outcomes, including sales, back to one creator graph. Better matches lead to better results, more campaigns and more data.

ADOPTION FLYWHEEL

Proposal Copilot builds the habit in Slack, Sheets and Slides. Match and Pulse ship into the **same surface**, so there is almost no new workflow to learn.

CAPABILITY FLYWHEEL

Each build reuses the data mart, prompt library, error-handling templates, evals and governance, so it ships faster than the last.

WHY IT FITS A SERVICE AGENCY

It covers **win rate** (Proposal), **results and retention** (Match) and **margin per head** (all three). Time saved becomes capacity for more pitches, not smaller invoices.

Two tracks: I build while the analysts lay the foundation

	M0-1	M1-2	M2-3	M3-4	M4-5	M5-6
PM build track LOW-CODE, ME	**Discovery** Shadow users, time study, n8n setup	**Proposal Copilot v1** Shadow mode, then live	**Creator Match v1** Shortlist feeds the proposal "Creator Plan" (v1.1)		**Campaign Pulse v1** Insight, approval, action. Feedback loops and evals	
DA data track 2 ANALYSTS	**Data audit + BigQuery mart** Roster and past results, top 300 creators first		**Consent onboarding + tagging** Creator House OAuth, caption batches, ad connectors		**Commerce attribution** Promo codes, affiliate links, UTMs; outcomes written back	
Critical path START WEEK 1	**Meta App Review, Business Verification, TikTok app review**					
Gates GO / NO-GO		M2 10 AI-assisted proposals	M3 Match live in pilot	M4 Two squads live		M6 Phase 1 review, RMN business case

DEPENDENCIES

Match needs the mart, consent onboarding and a brand-safety taxonomy. Proposal v1.1 needs Match. Pulse needs ad, social and commerce pipelines. Match v2 needs Pulse outcomes. **RMN needs all three.**

WHY PROPOSAL SHIPS FIRST

It doesn't wait on the data mart. I ship a visible win while the analysts build the foundation, and Match later lands inside a tool people already use.

TASK 1 · DEPRIORITIZED, NOT DISMISSED

Year 2: not no, not yet

Three department heads asked for these. None gets its own build in Phase 1, but each gets something now and a clear trigger for when we start.

Creator RMN

FAILS GATE

WHY NOT NOW

A data product with no data foundation, no engineers and no partner contracts yet.

NOW · NO EXTRA BUILD

Commerce attribution inside Pulse. A PDPA data-sharing framework. Retail clients such as Lotus's and makro as design partners. A business case at month 6.

START WHEN

6+ months of creator-to-sales data across 50+ campaigns, one retail data partner LOI, and approved engineering budget.

Trend Monitoring

BUY

WHY NOT NOW

Commodity signals. The best data sits behind restricted APIs (TikTok's Research API excludes agencies). Indirect ROI.

NOW · NO EXTRA BUILD

Keep using existing tools such as TikTok Creative Center.

START WHEN

A two-vendor bake-off finds one with API access and PDPA-compliant terms. Its trend snapshot then plugs into Proposal Copilot.

DCO

FAILS RISK GATE

WHY NOT NOW

The highest likeness and IP risk, and the strongest creative resistance. Platforms already ship gen-AI creative tools.

NOW · NO EXTRA BUILD

A pilot of platform-native tools on product-only assets. A draft AI Likeness Rider and consent registry.

START WHEN

Pilot creators sign the rider, governance is approved, and a CD sponsors it.

Creator Match: brief in, explained shortlist out

PROBLEM

About **6 hours per shortlist**, and days for 100+ KOL campaigns. Picks lean on memory and follower counts. Past performance goes unused. Brand-safety checks are manual and inconsistent.

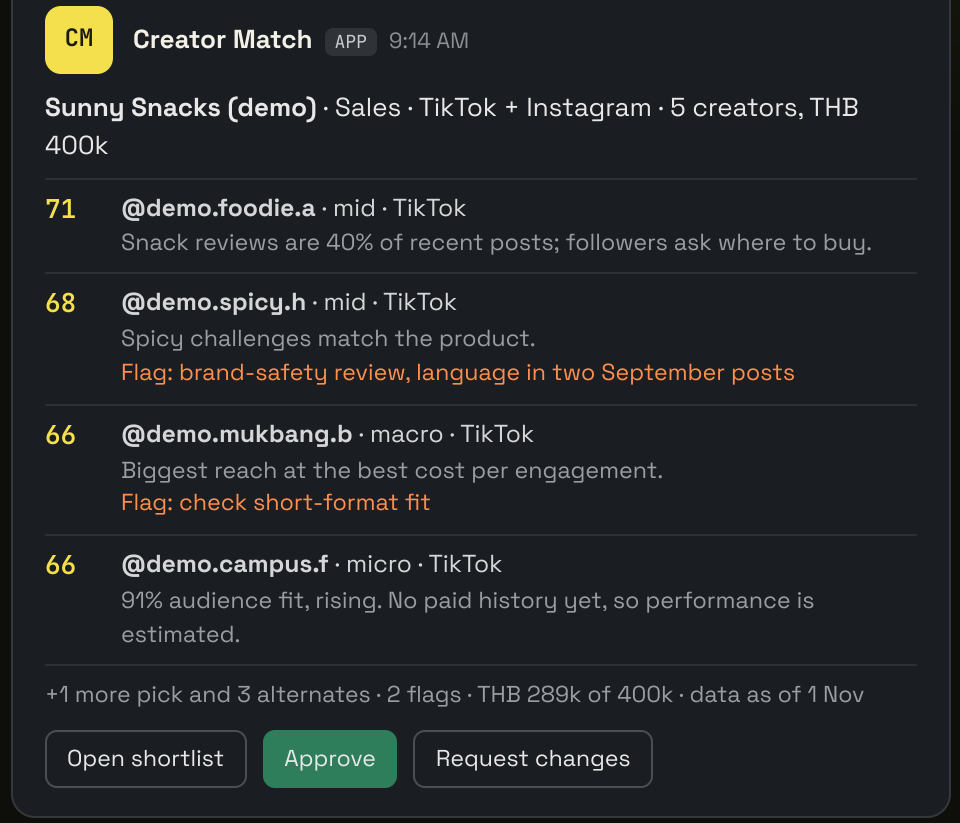

USERS AND THE JOB TO BE DONE

Strategists and talent managers (Creator House). Account managers request, CDs approve.

"Give me a defensible, brand-safe shortlist I can show a client today, and show me why."

V1.0 EXPERIENCE: NO NEW APP

1. Open the form pinned in Slack: 8 fields, or upload the client brief as a PDF.
2. 3-5 minutes later, a Slack card arrives with the top picks and a link to the shortlist Sheet.
3. Every pick shows its score breakdown, a rationale citing posts, risk flags, rate and data date.
4. Keep, swap or remove with a one-click reason, or "add my pick", which is scored too and never penalized.
5. Approve, and the shortlist flows into Proposal Copilot. Every decision is saved as feedback.

Demo output from the actual n8n workflow (CM-01) run on sample data. Out of scope in v1: outreach, rate negotiation, contracts, and any generated content that uses a creator's likeness.

Low-code on top, our data underneath

1 · SOURCES

Instagram Graph API v26.0
Business Discovery: public metrics

Creator OAuth (Creator House)
IG demographics, TikTok Display API

YouTube Data API v3
channels.list statistics

Internal history
roster, past results, rates

Vendor or TikTok One
audiences of non-consented creators

2 · INGEST

n8n CM-02, nightly
refreshes stale profiles, rate-limit aware

DA connectors
ad platforms and commerce reports

Claude Haiku 5.5 batches
caption tags and comment sentiment, 50% cheaper

3 · STORE

BigQuery
raw, then staging, then marts (Dataform)

Marts
dim_creator, creator_metrics, creator_audience, campaign_performance

Governance tables
consent_registry, match_feedback, ai_run_log

4 · INTELLIGENCE

n8n CM-01
orchestrates each brief

Claude Sonnet 5.5
brief parsing and brand-fit judge, JSON schema

Rules and scoring (code)
hard rules, weights, diversity, budget

OpenAI fallback
second vendor if Claude fails

5 · DELIVER

Slack
form, approvals, alerts

Google Sheets
the shortlist

Google Slides
via Proposal Copilot

Looker Studio
usage, cost, quality

FEEDBACK LOOP Every keep and remove, every override reason, and every campaign outcome flows back to BigQuery, which drives better weights, prompts and evals.

WHY THESE MODELS

Thai-language quality, **proven on our eval set**, not assumed. Reliable JSON via structured outputs. No open-source models in v1: self-hosting them needs engineers we don't have.

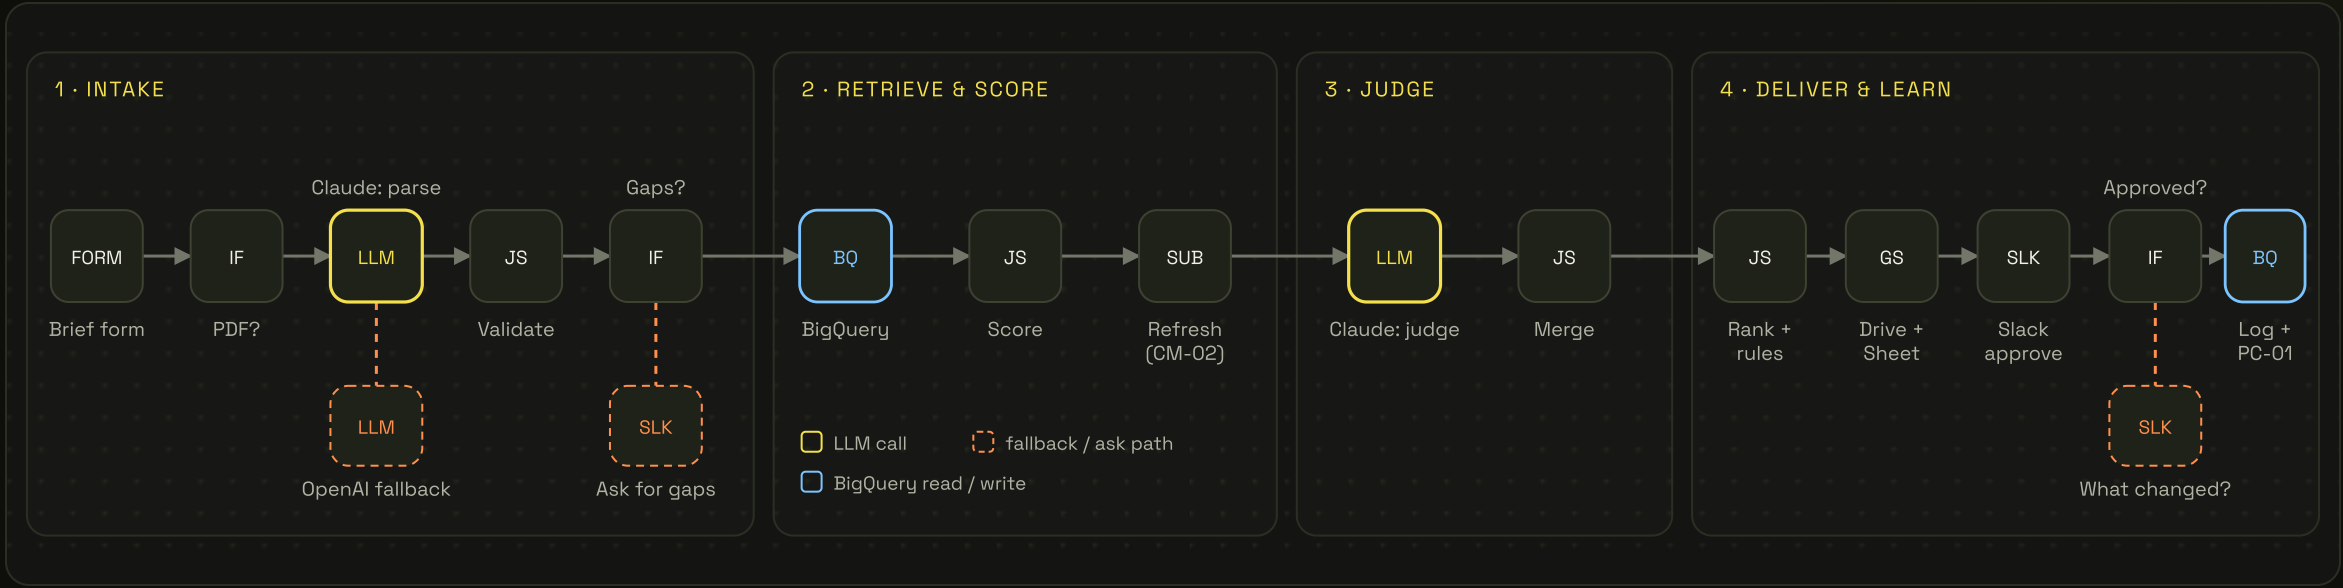

WHY N8N

Self-hosted, so data stays under our control (PDPA). Code nodes and Slack approvals built in. Make bills per module run, so a loop over 60 creators multiplies cost. LangChain needs engineers.

DESIGN RULE

The model is a config value. The data model is the asset. Prompts and schemas are versioned, and vendors can change without a rebuild.

CM-01: brief to shortlist in about 20 nodes

1 · INTAKE

Form Trigger, or a PDF via Extract From File. Then HTTP `POST api.anthropic.com/v1/messages` with `claude-sonnet-5-5` and `output_config.format` set to a JSON schema. Code validates the result; gaps go back to the requester through Slack Send and Wait. On error, the fallback is OpenAI `/v1/responses`.

2 · RETRIEVE AND SCORE

BigQuery GoogleSQL applies the **hard rules**: platform, consent, not blocked, no competitor work in 90 days. Code scores performance (Bayesian-shrunk history plus engagement vs tier), audience fit and cost per engagement. CM-02 refreshes stale profiles.

3 · JUDGE

One Claude call per creator, in batches of 5, 1 s apart. It returns brand fit 0-100, a rationale citing posts, risk flags and confidence. A failed call becomes **"not assessed"** and never blocks the shortlist.

4 · DELIVER AND LEARN

Weights by objective, budget fit, at least one rising creator, flags shown and never dropped. Then Drive copy and Sheets, then Slack Send and Wait (approval, restricted approvers), then Proposal Copilot. Every decision is logged to BigQuery.

Degrade gracefully, fail loudly to ops, never silently to users

FAILURE	HOW WE DETECT IT	RESPONSE
Timeout: 60 s for LLM, 30 s for social APIs	HTTP Request timeout	Retry 3 times, 5 s apart. Then the fallback model, or cached data labeled "data as of".
Rate limit: 429, or Meta codes 4, 17, 32, 613, 80002	Status, error code, usage headers at 80%+	Stop that branch and defer the rest to the next run. Never hammer the API.
Server error: 5xx, Anthropic 529	Status	Retry, then switch vendor. Alert if more than 5% of a day's calls fail.
Auth: 401 / 403, Meta code 190	Status, error code	No retry. Alert the token owner and send the creator a reconnect link.
Bad input: 400 / 404 (handle changed, personal account)	Status	No retry. Flag the record for the talent team to fix.
LLM refusal or invalid JSON	`stop_reason`, schema check	One repair prompt, then the fallback model, then "not assessed".
Some creators fail, others succeed	Per-item error output	Continue with the rest. Show the flags in the shortlist.

Every workflow's error workflow is **OPS-01**: a Slack `#ai-ops` alert, a dead-letter table, then retries at 5 min, 30 min and 2 h before a human picks it up.

COST PER SHORTLIST

$0.35

about THB 12

Brief parsing (Sonnet 5.5)	$0.03
20 brand-fit calls	$0.32
Nightly tagging (Haiku 5.5, batch)	< $10 / mo
n8n VM + BigQuery	tens of $ / mo
Total run cost	< $100 / mo

Against about **90 strategist-hours saved a month** (20 briefs x 4.5 h), before counting better campaign results.

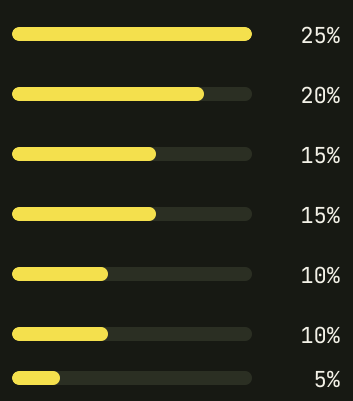

Prices per million tokens, Oct 2026: Sonnet 5.5 $2 in / $10 out; Haiku 5.5 $0.10 / $0.50.

Rent the model, own the memory

GATES FIRST: PASS OR FAIL

- GATE Commercialization rights: can we embed or resell it in a client-facing product?
- GATE No training on, or pooling of, our data, client data or creator data.
- GATE A PDPA-compliant DPA with cross-border safeguards.

THEN WEIGHTED CRITERIA

LAYER (CREATOR MATCH)	DECISION	WHY
LLM	BUY · 2 VENDORS	A commodity that improves monthly. Keep the switching cost low.
Orchestration	BUY · N8N	Fits a team with no engineers. Self-hosted, so data stays with us.
Warehouse	BUY · BIGQUERY	Serverless and cheap at our scale.
Public creator data and fraud signals	BUY OR PARTNER	A vendor or TikTok One gives fast coverage. Not a moat.
Consented first-party creator data	BUILD	Creator House OAuth. Competitors can't copy it.
Creator graph, scoring, feedback labels	BUILD	The moat. It compounds with every campaign.
Client-facing product (Year 2)	BUILD OR WHITE-LABEL	Commercializing means owning the UX and the data. White-label only with resale rights.

PATH TO COMMERCIALIZATION

Phase 1
Internal tool: hours back, better picks

End of Phase 1
A "Creator Match report" inside every proposal

Year 2
A paid creator-intelligence add-on or retainer

Year 2+
RMN measurement: creator traffic to retail sales

Three risks to control before any third-party gen AI touches client work

01

Creator likeness and personality rights

RISK

A vendor tool reproduces a creator's face, voice or style beyond what they agreed to, or trains on creator assets. Our celebrity network raises the stakes.

CONTROLS

- **AI Likeness Rider:** opt-in per use, payment for synthetic variants, approval rights, a kill switch, no vendor training.
- **Consent registry checked in code** before any generative step that touches creator assets.
- **Platform labels:** TikTok, YouTube and Meta AI-disclosure rules.

02

Synthetic media licensing and output IP

RISK

Clients receive AI-generated assets whose ownership is unclear, or that infringe third-party IP through the vendor's training data.

CONTROLS

- **Vendor contract:** output ownership to us or the client, IP indemnity, a warranty that training data is licensed.
- **Asset register:** model, prompt, human edits and approvals, plus C2PA credentials where supported.
- **Client contracts** disclose AI use and allocate risk.

03

Training-data privacy and client confidentiality

RISK

A vendor retains or trains on briefs, personal data or results. With 750+ brands, data could leak between competing clients through shared retrieval.

CONTROLS

- **Contract terms:** no training, limited retention, a DPA, PDPA cross-border safeguards.
- **Minimize:** send aggregates, redact personal data, and **isolate each client** in retrieval.
- **Operate:** role-based access, audit logs, a DPIA before go-live.

Principle: consent and confidentiality are enforced in code, not in a policy document. If the registry says no, the workflow cannot run.

Earn adoption squad by squad

Embed, don't add | Start with the work people hate | Co-design with skeptics | Prove it with their own briefs | Time back goes to creative work

WEEKS 1-4 · DISCOVER

Listen first

Shadow 8 users across strategy, creative, media and talent. Run the time study. Form a design council that includes the **most respected skeptical CD**. Co-write the "AI must never..." list.

MONTHS 1-2 · SHADOW PILOT

Prove it safely

One squad on social-commerce clients, where outcomes are measurable. AI runs alongside the manual process. **Nothing reaches a client** until the squad says it's useful.

MONTHS 2-4 · CHAMPIONS

Let users sell it

One champion per squad. A weekly 15-minute show-and-tell **run by users, not by me**. "AI Clinic" office hours, borrowing the Creator Clinic idea. A public "you said, we changed" log.

MONTHS 4-6 · SCALE

Make it the default

Squad-by-squad onboarding: 30 minutes plus a playbook. Leaders use the tools in pitch reviews. AI-assisted wins are recognized at town halls. Default on, still optional.

MESSAGING

"Less admin, more ideas." Never framed as headcount reduction. Leadership says out loud that time saved is reinvested in creative work.

INCENTIVES

Credit goes to the strategist on every win. People who give feedback and labels are recognized. AI use shows up in reviews as craft, not as compliance.

Empowerment by design: guardrails, overrides, feedback

G Product guardrails

- **Evidence or silence.** Every score shows its breakdown, sources and data date. Thin data gets ”low confidence”, never a guess.
- **Hard rules run before the AI.** Exclusions, consent, blocked creators and budget caps are code the LLM cannot override.
- **No autonomous outward actions.** Clients, creators and spend each need a named approval, with an audit trail.
- **Spend caps in Pulse:** at most ±20% a day, a 24 h cooldown, one-click revert.
- **AI-DRAFT watermark** until a human marks each section reviewed.

O Creative override controls

- Swap, remove, add or reorder any creator. Edit anything. Regenerate a section with an instruction.
- **Human-owned zones:** the Big Idea and creative territories belong to the strategist. AI offers options only on request.
- **Tune the matrix** per brief with presets like ”proven sales” or ”rising creators”.
- One-click override reasons. **Never penalized.** The human choice is the decision of record.
- An **off switch** per brief for any squad lead.

F Active feedback loops

- Inline keep or remove with a reason, and a rating on each rationale.
- Weekly prompt and weight updates, published as ”you said, we changed”.
- **Outcome calibration:** predicted vs actual for AI-picked and human-added creators. Used to learn, never to grade people.
- A monthly **AI Council** with CDs reviews edge cases and approves weight changes.
- A golden set of 30-50 past briefs gates every prompt or model change.

The AI earns trust by being **checkable**, **overridable** and **visibly improving**. A Creative Director should feel like the editor, never the reviewer of a machine.

Two metrics that prove adoption, not activity

QUANTITATIVE · ADOPTION

AI-assisted brief coverage

The share of new briefs whose final client proposal used Creator Match or Proposal Copilot output. Tracked automatically through the request ID.

50%	70%	40%
PILOT SQUAD · M3	PILOT SQUADS · M6	AGENCY-WIDE · M6

Why this one: it counts real work flowing through the tool, not logins. Use is voluntary, and the number is hard to fake.

Health checks: acceptance of AI picks stays within 40-80% · zero client-facing AI factual errors · first proposal draft in under a day.

QUALITATIVE · TRUST

Creative Confidence

A monthly 3-question pulse, plus 6 interviews with CDs and strategists.

> ”It makes my work better, not just faster.”

> ”I trust it enough to show my CD or client.”

> ”What would you miss if it disappeared?”

Success: CDs describe it as empowerment (”time back”, ”a better starting point”), not threat or admin, in their own words. At least 70% agree with the first statement by M6, and 3+ squads ask for access unprompted.

KILL / PIVOT RULE If pilot coverage is under 25% at month 3, or the pulse says ”admin burden”, pause the rollout and fix the product. Don’t push harder.

What I need, and my first 30 days

WHAT I NEED

1. **Analyst time:** both DAs at least 70% on the transformation.
2. **Platform access:** a sponsor for Meta App Review, Business Verification and TikTok app review, filed in week 1.
3. **A pilot squad,** plus the most respected skeptical CD on the design council.
4. **Legal and DPO** for the AI Likeness Rider, vendor DPAs and the DPIA.
5. **At most USD 1,000 a month** for tools, and no new headcount in Phase 1.

MY FIRST 30 DAYS

WEEK 1	Shadow users, start the time study and the data audit, file the platform app reviews.
WEEK 2	Design council, the "never" list, baselines for every metric.
WEEK 3	Proposal Copilot prototype running in shadow mode with the pilot squad.
WEEK 4	First AI-assisted proposals, the first changelog, and a go / no-go for the pilot.

Phase 1 earns the right to build the RMN.

Three tools, one loop, one data asset that compounds with every campaign.

Why each use case scored what it did

USE CASE · SCORES (I / F / M / S / A)	RATIONALE
Campaign Proposal 4 / 5 / 3 / 5 / 4	Every new-business and upsell baht passes through a proposal, and strategist hours are scarce (I4). Inputs already exist as documents, and LLM + Slides is a proven low-code pattern (F5). Deck generation is a commodity until it is grounded in our case studies and Match output (M3). v1 ships in 4-6 weeks (S5). It is an internal draft, reviewed before any client sees it (A4).
Creator Selection Matrix 4 / 4 / 5 / 3 / 4	The first decision in every campaign; fit drives results and retention (I4). Transparent scoring plus an LLM brand-fit check, with no model training, but it needs the data mart (F4). The creator-performance graph is the most defensible asset we can own (M5). Gated by the data foundation, about 6-8 weeks (S3). It supports judgment rather than replacing it (A4).
Campaign Optimization 4 / 3 / 4 / 3 / 3	Protects live results and automates reporting hours (I4). Needs ad, social and commerce pipelines, and any write action needs governance (F3). Its outcome and sales data trains Match and seeds the RMN (M4). It needs pipelines first (S3). Planners are data-literate, but spend changes carry risk (A3).
Creator RMN 5 / 1 / 5 / 1 / 2	The biggest prize and the stated mission (I5, M5). But it is a data product with no data foundation, no engineers and no partner contracts yet (F1, S1). Commercial, legal and in-group data-sharing complexity (A2).
Trend Monitoring 2 / 3 / 2 / 4 / 4	ROI is indirect and hard to attribute (I2). The best signals sit behind restricted APIs, and vendors exist (F3). Everyone sees the same public trends (M2). Vendor tools work today (S4). Low disruption (A4).
DCO 3 / 2 / 2 / 2 / 1	A creator-led agency sells authenticity (I3). Production-grade generation plus approvals is heavy for low-code (F2). Platforms ship gen-AI creative natively (M2). The highest likeness and IP risk, and the most "AI replaces me" fear (A1).

I = impact, F = feasibility under our constraints, M = moat and compounding, S = speed to value, A = adoption and risk (5 = low risk). Base weights: 30 / 25 / 20 / 15 / 10.

The first release: a simpler version of the same pattern

Brief form or Slack → **Claude parses the brief** JSON schema → **SQL: top 10 past case studies** by category and objective → **Claude drafts slide-by-slide JSON** with 3 Big Idea territories → **Drive files.copy** master template → **Slides batchUpdate** replaceAllText →

Number-grounding check → **Slack to the strategist** AI-DRAFT watermark → **Log the AI content survival rate**

WHY NO VECTOR DATABASE IN V1

With a 1M-token context, SQL filtering plus the full text of the top 10 case studies is enough. Add BigQuery `VECTOR_SEARCH` with `gemini-embedding-001` (supports Thai) when the library outgrows that.

GUARDRAILS

Every figure in the deck must match a source row, or it is highlighted for review. The Big Idea is strategist-owned: AI offers 3 territories, never a final answer. Nothing goes to a client from the workflow.

ENDPOINTS

`POST googleapis.com/drive/v3/files/{id}/copy`

`POST slides.googleapis.com/v1/presentations/{id}:batchUpdate` with `replaceAllText` and `replaceAllShapesWithImage`.

Success for v1: a first draft in under a day instead of about three, and strategist edits concentrated on the Big Idea instead of formatting and research.

Recommend, approve, act, then learn from the result

Daily at 08:00 → **BigQuery** yesterday's ads, creator posts, sales → **Rules vs targets** CPA, CPV, ER vs benchmark, fatigue → **Claude explains** up to 3 actions, impact, confidence → **Slack approval** to the planner →

If approved and in guardrails Meta POST /v26.0/{adset_id} → **72 h later** did it work? → **Outcomes to the creator graph**

DATA IN

Meta `GET /v26.0/{adset_id}/insights?fields=spend,impressions,clicks,actions&date_preset=yesterday&level=ad`, TikTok API for Business reports, creator post metrics, and promo-code and affiliate sales. **The sales data is the RMN seed.**

GUARDRAILS

At most ±20% budget change a day, a 24 h cooldown, one-click revert, restricted approvers. Budgets are sent in minor units (THB offset 100). Nothing changes without a named approval.

WHY IT MATTERS

Real outcomes turn Creator Match from "looks right" into "proven to sell", and they become case studies and benchmarks for Proposal Copilot.

"Automated adjustments" in v1 means automated recommendations. The machine prepares the change; a planner makes it. We loosen this only when the outcome data earns it.

Endpoints, access and limits

API	REQUEST	ACCESS AND LIMITS
Instagram Business Discovery	`GET graph.facebook.com/v26.0/{our_ig_id}?fields=business_discovery.username({handle}){followers_count,media_count,media{caption,like_count,comments_count,timestamp,permalink}}`	Business or Creator accounts only. `instagram_basic`, `instagram_manage_insights`, `pages_read_engagement`. App Review and Business Verification.
Instagram audience	`GET /v26.0/{creator_ig_id}/insights?metric=follower_demographics&period=lifetime&metric_type=total_value&breakdown=age`	The creator's own token (Creator House OAuth), 100+ followers. Watch `X-App-Usage` and `X-Business-Use-Case-Usage`; throttling codes 4, 17, 32, 613, 80002.
TikTok Display API	`GET open.tiktokapis.com/v2/user/info/?fields=follower_count,likes_count,video_count` · `POST /v2/video/list/` (max_count 20)	Consented creators via Login Kit: `user.info.stats`, `video.list`. The Research API excludes agencies.
YouTube Data API v3	`GET youtube/v3/channels?part=snippet,statistics&id={channelId}`	1 unit of a 10,000-unit daily quota. Demographics need the owner's OAuth (Analytics API).
Meta Marketing API	`GET /v26.0/{adset_id}/insights` · `POST /v26.0/{adset_id}` (daily_budget)	Business Manager access. Writes only after a human approval.
Claude Messages API	`POST api.anthropic.com/v1/messages` · `POST /v1/messages/batches`	`anthropic-version: 2026-10-21` (no temperature). `output_config.format` with a JSON schema. Handle `stop_reason: refusal`.
OpenAI (fallback)	`POST api.openai.com/v1/responses`	`text.format` json_schema. API data is not used for training by default.
Google	`POST /drive/v3/files/{id}/copy` · `POST /v1/presentations/{id}:batchUpdate` · `POST /bigquery/v2/projects/{p}/queries`	Set `useLegacySql: false` for GoogleSQL.

Checked against official documentation on 29 Oct 2026. Graph API v26.0 was the latest version at the time.

A transparent formula, with starting weights to calibrate

$$\text{match} = w_{perf} \times \text{Performance} + w_{aud} \times \text{Audience fit} + w_{brand} \times \text{Brand fit} + w_{cost} \times \text{Cost efficiency} \quad \text{(each 0-100)}$$

COMPONENTS

- **Performance:** 70% campaign history vs benchmark, Bayesian-shrunk (k = 3) so one lucky campaign doesn't dominate, plus 30% engagement vs tier median.
- **Audience fit:** the share of the creator's audience matching the brief's age, gender and location, from consented demographics or a vendor.
- **Brand fit:** Claude's 0-100 judgement from recent captions, tags and comment sentiment, citing posts. If it can't be assessed, audience fit stands in and the row is flagged "not assessed".
- **Cost efficiency:** the creator's cost per expected engagement compared with the category benchmark.

STARTING WEIGHTS BY OBJECTIVE

OBJECTIVE	PERF.	AUD.	BRAND	COST
Sales	35	25	20	20
Awareness	20	35	25	20
Engagement	25	25	30	20

Sales: proven conversion matters most; brand fit stays a safety lever. **Awareness:** reaching the right people comes first; history matters less at the top of the funnel. **Engagement:** community briefs live or die on tone and authenticity.

Rules around the score: hard rules first (consent, blocked, competitor work in 90 days, rate cap of 1.2x budget per creator). Then budget fit, at least one rising creator, and flags shown, never dropped. Weights are calibrated with CDs in the pilot, then against campaign outcomes.

Short answers to the hard questions

”RMN is our strategy. Why not first?”
It’s a data product that needs a clean creator graph, commerce attribution, consent and engineers. Phase 1 produces the first three as by-products, so Year 2 starts well ahead instead of from zero.

”What if Meta or TikTok change their APIs?”
External data lands in BigQuery through one refresh workflow per platform, and scoring reads only from the marts. Pin versions, watch changelogs, keep a vendor fallback.

”How do you know the LLM is any good?”
A golden set of 30-50 past briefs: overlap with expert picks, brand-safety recall, rationale faithfulness, JSON validity. It gates every prompt or model change.

”Isn’t no-code a bus-factor risk?”
Workflows exported to Git, naming conventions, a runbook, analysts cross-trained, and OPS-01 monitoring with alerts.

”How do you get audience data without scraping?”
Public metrics via Business Discovery. Demographics via creator OAuth through Creator House, in exchange for insights. A vendor or TikTok One for the rest. Never scraping.

”Won’t it always pick the same big creators?”
Tier normalization, Bayesian shrinkage, a rising-creator rule, cost per engagement instead of follower count, and monitoring of how picks spread across tiers.

”What if the analysts get pulled into reporting?”
Campaign Pulse automates part of reporting to buy their time back, and the 70% allocation is my first ask.

”What if the CDs refuse?”
No mandate. Volunteers first, shadow mode, take away the work they hate, let peers show the results, and respect the off switch.
